To deploy your new build to the live service you need to have access to two different things:

- The first being the original repository that the Global Civil Discourse map was deployed from:
  - https://github.com/AaronHaNasi/team-civil-discourse
- The second being the Heroku account sign in details to log into at Heroku.com
  - Message Professor Lowenstein for details about sign in information for AWS, Heroku, and contact information for Aaron (the owner of the original repository)

After these two are secured, push your build to the original repository, then go to heroku

Navigate to civil-discourse-map > deploy

Scroll down and deploy the map from the most recent push.

Check the live service to confirm deployment
